

they all basically sense the clarity of the water. When the water is clear, it means the dishes are clean (no more food particles are coming off) and it stops.

From a styling standpoint, you have three basic options. A prefinished front, painted or stainless steel, is most common. Trim, which matches your cabinets, is added to create an integrated front, but the control panel still shows.

Electric heat

Q: Our church has baseboard electric heat in a small separate building, and we use it only on Sundays and Wednesdays. Should we set

back the thermostat to 62 degrees or much lower when not in use? – Phil H.

A: Some people think you should not set the thermostat too low because it just uses more energy to reheat the room later. This is not true. The lower you can tolerate setting the thermostat, the more you will save.

You should be able to set the temperature lower without causing any problems to the materials in the building. A temperature setting from 50 to 55 degrees is reasonable when the building is not being used.
